

BOG RM

转鼓格栅机

BOG RM Rotary Drum Grille

产品简介 / PRODUCT DESCRIPTION

BOG RM 转鼓格栅机是一种在传统旋转格栅技术上革新部分原理的机械过滤方法。它适用于把液体中存在的较大悬浮物质（如纺织印染、农业养殖、沼液垃圾、纸浆纤维等）最大限度地分离出来，实现固、液分离的目的。BOG-RM 转鼓格栅机与其它过滤方法的区别在于过滤介质空隙小，借助筛网回转的离心力，在较低的水利阻力下，高效率分离截留住悬浮杂质。

这种新型的水处理设备，主要去除废水中的纤维状物质，设备全密封高效循环重复使用，节约污水处理成本设备广泛适用于需进行固液分享的各种场合，如渗滤液、造纸、纺织印染、化工污水、城市生活污水、农业养殖等。尤其适用于纺织印染、造纸白水的处理。

BOG RM Rotary drum grille is a new kind of mechanical filter, which is widely used to separate micron rating suspended substances from liquid, for example sewage treatment of textile, printing and dyeing, agricultural breeding, biogas slurry, pulp fibre separation and etc. BOG-RM Rotary drum grille with very small gap of filter medium, which can intercepts suspended solids with the help of grille centrifugal force to keep a high flow velocity under low hydraulic resistance.

As one of new water treatment equipments, Rotary drum grille is mainly used to remove fibers from waste water, such as sewage treatment in municipal, leachate, papermaking, textile, printing and dyeing, chemical industries and agricultural breeding etc. It has a excellent performance in sewage treatment of textile, printing and dyeing, and papermaking plant of white water filtration, close cycle of water reuse achieves great saving of cost in sewage treatment.

设备特点 / CHARACTERISTICS

01 设备结构简单高效，运行平稳，维修方便，使用寿命长。
Simple structure, smooth operation, easy maintenance and long service life.

02 设备占地面积小、运行费用低、安装方便、节水节电。
Space saving and low operation cost, low water consumption and easy installation.

03 设备水头损失小，节能高效。
Small head loss and energy saving.

04 设备整体为全不锈钢材质，强度及耐腐蚀性极强。
High corrosion resistance and strong strength of stainless steel structure.

05 设备过滤能力优益，固液分离效率高，一般废水纤维回收率大于80%。
High capacity and efficient separation, general fiber removal rate is over 80%.

06 设备运行转速低并自动保护，全自动控制系统无需专人看管，回收纤维浓度最高可达12%以上。
Automatic control of operation, with no need of a special person to care about, the concentrate fiber is more than 12%.

PURIFICATION IN ACTION

工作原理 / WORKING PRINCIPLE

污水从进口进入布水器，经短暂稳流后，由出水口均匀溢出，分布在反方向旋转的滤筒滤网上，水流与滤筒内壁产生相对剪切运动，过水效率高，固体形态物质被截流分离并顺着筒壁内螺旋导向板翻滚向前输送，由滤筒前端排污口排出。从滤网滤出的废水在滤筒两侧的防护罩导流作用下从正下方倒流水槽中流走。设备滤筒外配有高效冲洗水管(3bar)，冲洗水呈扇形喷射清洗滤网，确保滤网始终保持高效过滤。

Raw water fills into the inner distributor through the inlet, and distributed to the inner grille screen surface after steady. Clean water pass through the grille screen vertically for efficient filtration. While solids are intercepted by the screen and delivered by the inner rotary guide plates to the drainage valve. Rotary drum grille has a flushing nozzle outside the grille cylinder, clean water through the fan-shaped nozzle begins backwashing the grille cylinder under the water pressure of 0.3MPa. Dirty water after backwashing concentrates to the bottom collecting tank, and discharged.

	RM-2.5	RM-5	RM-7	RM-9	RM-11	RM-14	RM-18
过滤面积 inch ² (cm ²) Filtration area	3875 (25000)	7750 (50000)	10850 (70000)	13950 (90000)	17050 (110000)	21700 (140000)	27900 (180000)
